Article - SMARTPHONE-BASED MOBILE ACCESS CONTROL

SECURITY MIDDLE EAST - Nº98 - September 2017

Vincent Dupart explains how to select the right management and configuration tools

Our solution is extremely user friendly, with a range of different identification methods available – you can just tap your phone, or lightly touch the access control reader to identify yourself. Beyond this, we have chosen a virtualization solution that requires no compromises to the philosophy undergirding your organization's security policy.

Why would you outsource your data to

a third party? Where is the data stored?
Are you independent in managing your security? No technical or technological constraints should prevent Directors of Security from managing their systems independently, with the freedom to host sensitive data in-house if that's what they want... We offer our clients an Offline management tool, which keeps them in control of their security. That's a key issue in our line of work!

Can you tell us a bit more about the Online management platform that you are planning to officially launch at the APS Show in late September?

Innovation is the cornerstone of STid's strategy. We've continued to work to develop a secure Web platform which will revolutionize the way we manage user virtual access cards and configure readers!

Access rights can be assigned, revoked and updated in real time, meaning you can quickly create a short-term visitor access card, and later recover the credits to create another virtual access card. It's so cheap and easy to use!

How does this platform meet clients' aspirations to manage their systems independently?

Unlike many solutions on the market and most people's preconceptions about cloud technology, STid is not looking to tie its clients into a particular technology. Independence operates at many different levels!

First and foremost, we have always wanted to respect our clients' value chain. Anyone will be able to create an account and associate accounts for their own clients (dealers and end customers), without any involvement on our part.

STid has no access to sensitive data in the dealer and end customer accounts – that would be a major security vulnerability. Our clients will remain totally independent in managing their security.

How do you secure the data stored in your Web platform?

Today's businesses work in an ever-more mobile world, with a continually increasing threat of cyberattacks. Security is a major challenge. In addition to the security benefits of the client's independence in management, all data is stored in our server in France, in accordance with the

tightest data protection regulations issued by CNIL (the French data protection authority). The information is stored in encrypted formats and all server connections use the secure https protocol. The virtual access cards are managed in real time so if an employee reports the loss of a smartphone, the mobile access rights can immediately be revoked, before the device ends up in the wrong hands.

The different identification methods of your STid Mobile ID® solution make access control instinctive. How is this user experience carried across to your Web platform?

Our two priorities are security and userfriendliness. The STid Mobile ID* Web platform will be easier to use than conventional tools, making it quicker to access data, which is all centralized on a single platform.

Different levels of rights can be assigned to each account – administrator, user, etc. Data can then be shared, enabling multiple client employees to work on the platform in real time.

Data entry times are reduced by an easy upload function for your existing databases (variable and fixed data, photos, logos, etc.), which will boost the performance of your access solution.

See you in September for the launch of the STid Mobile ID® management
